Isolated hepatic perfusion for patients with multiple hepatocellular carcinoma: outcomes of a prospective phase I-II trial. In most patients with liver cancer, curative treatment by resection or liver transplantation is not possible. Liver resection is restricted to patients with limited disease or liver metastases. Hepatic perfusion with cytotoxic drugs has proven to be of clinical benefit in patients with unresectable primary liver tumors and has been shown to have antitumor activity in patients with metastatic hepatic tumors. This study investigated the use of isolated hepatic perfusion with the cytotoxic drug 5-fluorouracil in patients with primary hepatocellular carcinoma. The toxicities and the antitumor activity of isolated hepatic perfusion were prospectively evaluated in a phase I-II clinical trial. A total of 45 patients with primary hepatocellular carcinoma and 10 patients with multiple hepatocellular carcinoma were included. The resection rate was 50%. The median survival time of the patients with single hepatocellular carcinoma and multiple hepatocellular carcinoma was 18.9 months and 8.9 months, respectively. The median survival of patients with tumor size Military Further Reading

Drafters' models in fight for High Bridge The Australian Department of Defence is to be given a new "master planning model" to cope with all of the new construction required in the next decade. A model for the next 20 years, to be released in October, is to be about planning for "all requirements", not just weapons and nuclear systems, although the high profile LAND 400 ballistic missile defence project would be a priority. "The model is basically a snapshot in time, a picture of the 82157476af
