[Why Is It Easier For You To Make Sharp Turns More Quickly When Your Center Of Gr...](#)

**NOTES:**

1. When the vehicle is loaded, the combined center of gravity (CG) shifts toward line B-C. Theoretically the maximum load will result in the CG at the line B-C. In actual practice, the combined CG should never be at line B-C.

2. The addition of more counterweight will cause the truck CG to shift toward point A and result in a truck that is less stable laterally.
